

Experiment-1: Fisheries extension-a two way link (Date: xx.xx.xxxx, Page no.....)

Fisheries extension is a continuous educational process where a close cooperation is maintained between scientific institutes and fish farmers. It is because, if comprehensive research is not carried out properly progress may not be expected in desired speed and direction. Moreover, if the research findings are confined to it's source only and are not passed on the actual life situation of fish farmers, their problems will be remained unsolved. This calls for a line of communication of scientific information from the source to ultimate users (fish farmers).

Thus, fisheries extension serves the responsibilities through it's wellorganized advisory service and we can define fisheries extension as a two way link- it brings certain information to the fish farmers and carries the farmer's problems to the scientific institutes for solution.
